ALLOS makes Excel the ideal partner for your ERP

- Flexibility and familiarity of Excel, combined with the performance and robustness of enterprise software, designed to respond to the daily difficulties of the various departments of companies;
- Directly in Excel, control over Reporting, reconciliation and closing processes, always with updated system data;
- Permanently, the consistency and accuracy of the information;

Why choose between two extremes, if Allos gives you the best of both worlds?

Excel is the most flexible platform, which is why we use it as a basis to develop tools that are tailor-made to respond to the specific needs of each area or department. With Allos, teams continue to use Excel, and it is Excel itself that becomes the best partner in enterprise systems.

BI software companies insist that their solutions are best suited to solve the daily problems of companies, but in reality the technology currently in existence still has little to do with providing answers and solving problems.

The main reasons to export to Excel are:

1

Total flexibility to work the information, in a way that the BI software does not allow, or, allowing, requires intense involvement of the IT teams, causing delays, frustration and entropy;

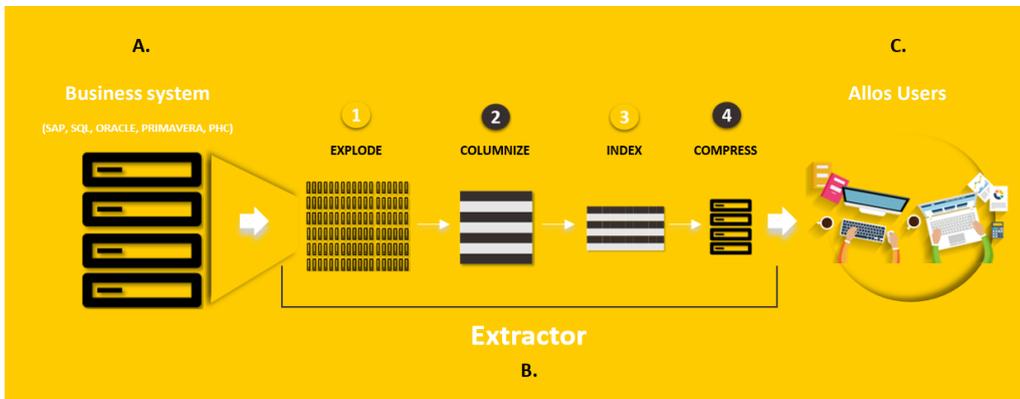

2

Total autonomy to directly change layouts and templates (graphics, dashboards, reports, forms, etc.).

The technology that companies use, must give them the maximum flexibility, together with the security and consistency of data always updated. Currently, BI software, Databases and Source Systems are excellent for collecting information, but inevitably this data is exported to Excel to be worked by the end user.

Allos

Excel becomes a super browser
and spreadsheets become lighter and faster than ever before

And all this, because ...

Allos ensures a much faster speed and does not make Excel slow because it does all the calculations and crosses of data out of Excel.

Allos's high performance capability in Excel is also due to the fact that it takes data tables (from databases or source systems) and converts them into columns (points 1, 2 and 3 of the diagram above) to build indexes of information that allow an extraordinary speed of access.

Allos Total flexibility, full autonomy

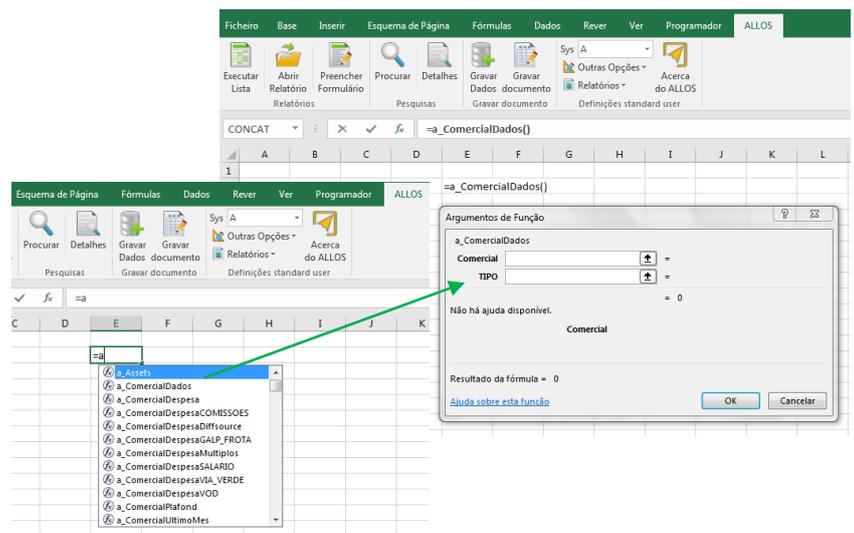

Allos Formulas

The real "bust" to your Excel

ALLOS formulas are Excel formulas, like any other, but where we introduce parameters chosen by the business and that fetch the data, not other worksheet locations, but directly to the company databases.

In this way, we always have updated, system and cross data out of the spreadsheet.

The big difference is that we will get the data directly to the databases, not having to export any data manually to Excel.

Allos uploads

With ALLOS, you can fill data wherever and whenever you want with the flexibility and ease of Excel or Word, but with the validations, control and security of an ERP system.

Users create the document based on the ALLOS template, in which information is entered and validated as in your system. These forms, like any Excel sheet powered by ALLOS, can simultaneously access management information and validate data from any system.

If it is used by collaborators without access to the central systems, it is enough to send the document, by any means, to a user or central repository, where the data can be loaded.

ALLOS is also used to change or load significant amounts of information by business users.

Main features

- Captures SAP screens, uses SAP BAPIs, or calls webservice;
- Enables automatic creation of data entry forms;
- It allows validating the fields to be entered, either by format or against tables of data;
- Ability to automatically create an Excel form from a SAP Desktop recording;
- Allows control of partial data loads.

Allos Reporting

ALLOS lets you create your own report template in Excel or Word with all the information, using Excel for the formats and graphics you want.

All this is done with complete flexibility in defining data listings or using Excel formulas, similar to "SUM", to put the data exactly where you want it, as you want.

In addition, ALLOS maintains the consistency of the data allowing it to be always updated with the correct and reliable information, and allows to control the accesses to the same data.

Main features

- Get updated data when you open Excel using the Allos formulas;
- Make listings of any data and allows creation of Pivot tables and iterative tables;
- Create and share reports that are just spreadsheets "powered by ALLOS";
- Possibility of drilldown for data details as well as surveys;
- It has all the functions of Excel;
- Allows you to extract data from SAP, SQL or any text file.

Allos Fin

Module adapted to the needs of the financial area

All the advantages of Excel. All the consistency and robustness of a BI | ERP system

Imagine that you could use the Sheets of Calculations that you have already developed and known in financial and accounting processes.

Imagine that Excel benefited from leverage that enabled it to manage all data, formulas, and database access, allowing for flexible workflow and robust data consistency and audibility.

This is how ALLOS works - through Excel and in an automated way - providing a unique solution that can be used by all Employees.

As a result, it is possible to gain significant time, dramatically reduce costs, increase productivity and make residual the risk of errors.

And it is no longer necessary to export to Excel because everything is already in Excel.

Speed up the information delivery process

Companies are constantly confronted with long and troubled closing processes.

Management demands that financial statements and other data come into the hands of key stakeholders as quickly as possible, but often the whole process is postponed because of the lack of the tools to do the job.

Speed up the Closing processes while substantially improving Data quality and integrity

ALLOS significantly improves closing processes by providing a solution that uses the language of finance and accounting departments around the world - Microsoft Excel.

Each component of the closing process can be managed, optimized and automated directly in ALLOS.

As a result, a process that should take only a couple of days can take up to three weeks. ALLOS Fin solution allows you to substantially reduce the time spent in the closing process by using the "native" tool of accounting and finance departments around the world - Microsoft Excel.
